EDUCATION

University of California, Los Angeles, Ph.D. in Civil Engineering (Transportation) — Sep. 2025 – Present
National University of Singapore, Master of Computing in Computer Science (CAP: 4.15/5) — Jan. 2022 – Jul. 2023
Nanjing University, B.Eng. in Industrial Engineering (GPA: 4.36/5) — Sep. 2017 – Jul. 2021

RESEARCH FOCUS

Generative modeling of multi-level human mobility, from macroscopic travel behavior to microscopic trajectories.

RESEARCH EXPERIENCE

UCLA Mobility Lab, Graduate Student Researcher (Advisor: Prof. Jiaqi Ma) — Sep. 2025 – Present

Diffusion-based daily activity generation, transferable via public aggregate statistics — first author, in prep.

- Built a conditional diffusion model with a Transformer denoiser that generates a person's full day jointly over *where*, *what*, and *when* (5,697 zones × 15 activities × 96 time slots), trained on 8.1M person-days from 618K GPS users in Los Angeles.
- Outperformed 8 generative baselines (incl. MoveSim, TrajGPT, MIRAGE) on 5 of 6 held-out realism metrics, with 45% and 44% lower activity-duration and activity-chain divergence than the strongest baseline.
- Formulated *aggregate-only transfer*: adapting the generator to a new year and unseen regions from published aggregate totals, without individual trajectories. Developing maximum-entropy guidance for it, which matches fine-tuning on individual-level data for the constrained statistics and cuts unseen-region distance error from 14.1 to 1.1 km.

Trip purpose inference from GPS trajectories — [1], co-first author

- GPS shows where people stop, not why, and has no labels at scale. Built a weakly supervised, uncertainty-aware pipeline that labels 81M staypoints via LLM-enriched POI semantic zones, Bayesian activity scoring, and multi-phase Pareto calibration to travel-survey statistics, cutting divergence in activity type, start time, and duration by 23%, 48%, and 12%.

Household-coordinated population mobility generation (PopTraj) — [3], co-author

- Led the population layer of PopTraj, a hierarchical pipeline that distills an LLM teacher into a hybrid CVAE: census-constrained household synthesis and home/work/school anchor assignment. The pipeline generates 395K household-coordinated person-weeks in Tokyo with 39% lower divergence than the best of 9 baselines.

MIT-NEU-UF Research Program, Advisors: Prof. Jinhua Zhao & Dr. Yuebing Liang — May 2024 – Jun. 2025

Deep reinforcement learning for transit-oriented development planning — [4], first author

- Recast station-area land-use planning as sequential decision-making on a parcel–road–station graph, with a combinatorial action space (land use × floor-area ratio) and a multi-objective reward encoding TOD indicators and reconstruction cost.
- Improved spatial efficiency by 70% and 54% over rule-based and genetic-algorithm baselines in a Shanghai case study.

NUS Master's Capstone, vision-language pipeline for dashcam driving-style profiling — Feb. 2023 – May 2023
NJU Undergraduate Thesis, deep RL with a Transformer policy for TSP local search — Jan. 2021 – Jun. 2021
